WHY HEDERA

- ERC-8004 IDENTITY REGISTRY
- MICROPAYMENTS / PRICING ENGINE
- IPFS METADATA

WHY X402 MATTERS

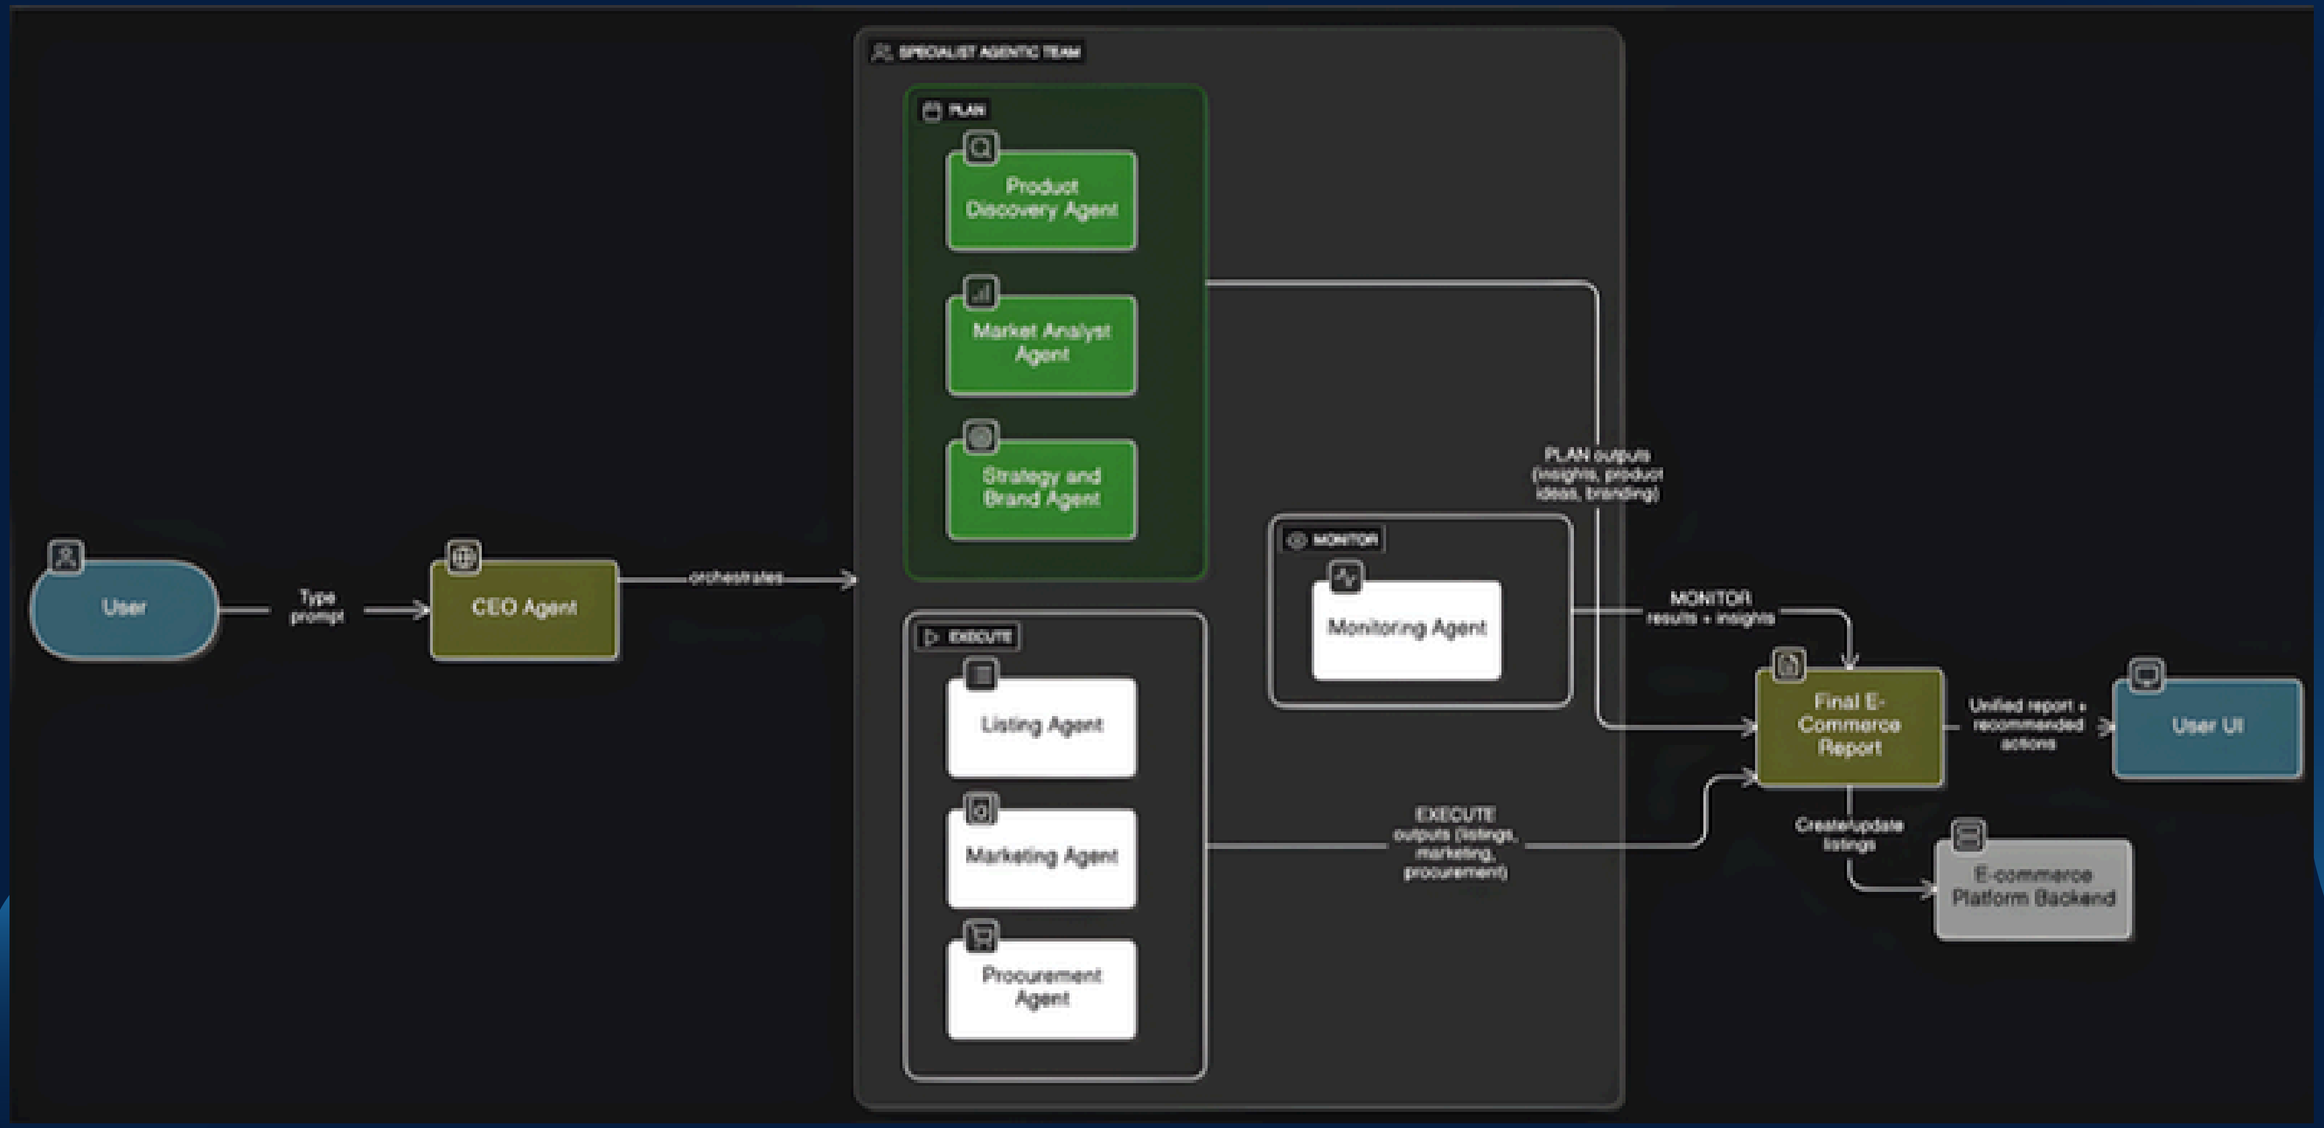

- PAY AI DIRECTLY FROM YOUR WALLET
- AI ONLY GETS PAID WHEN IT FINISHES THE JOB
- CREATES A SELF-SUSTAINING LOOP

OUR ARCHITECTURE

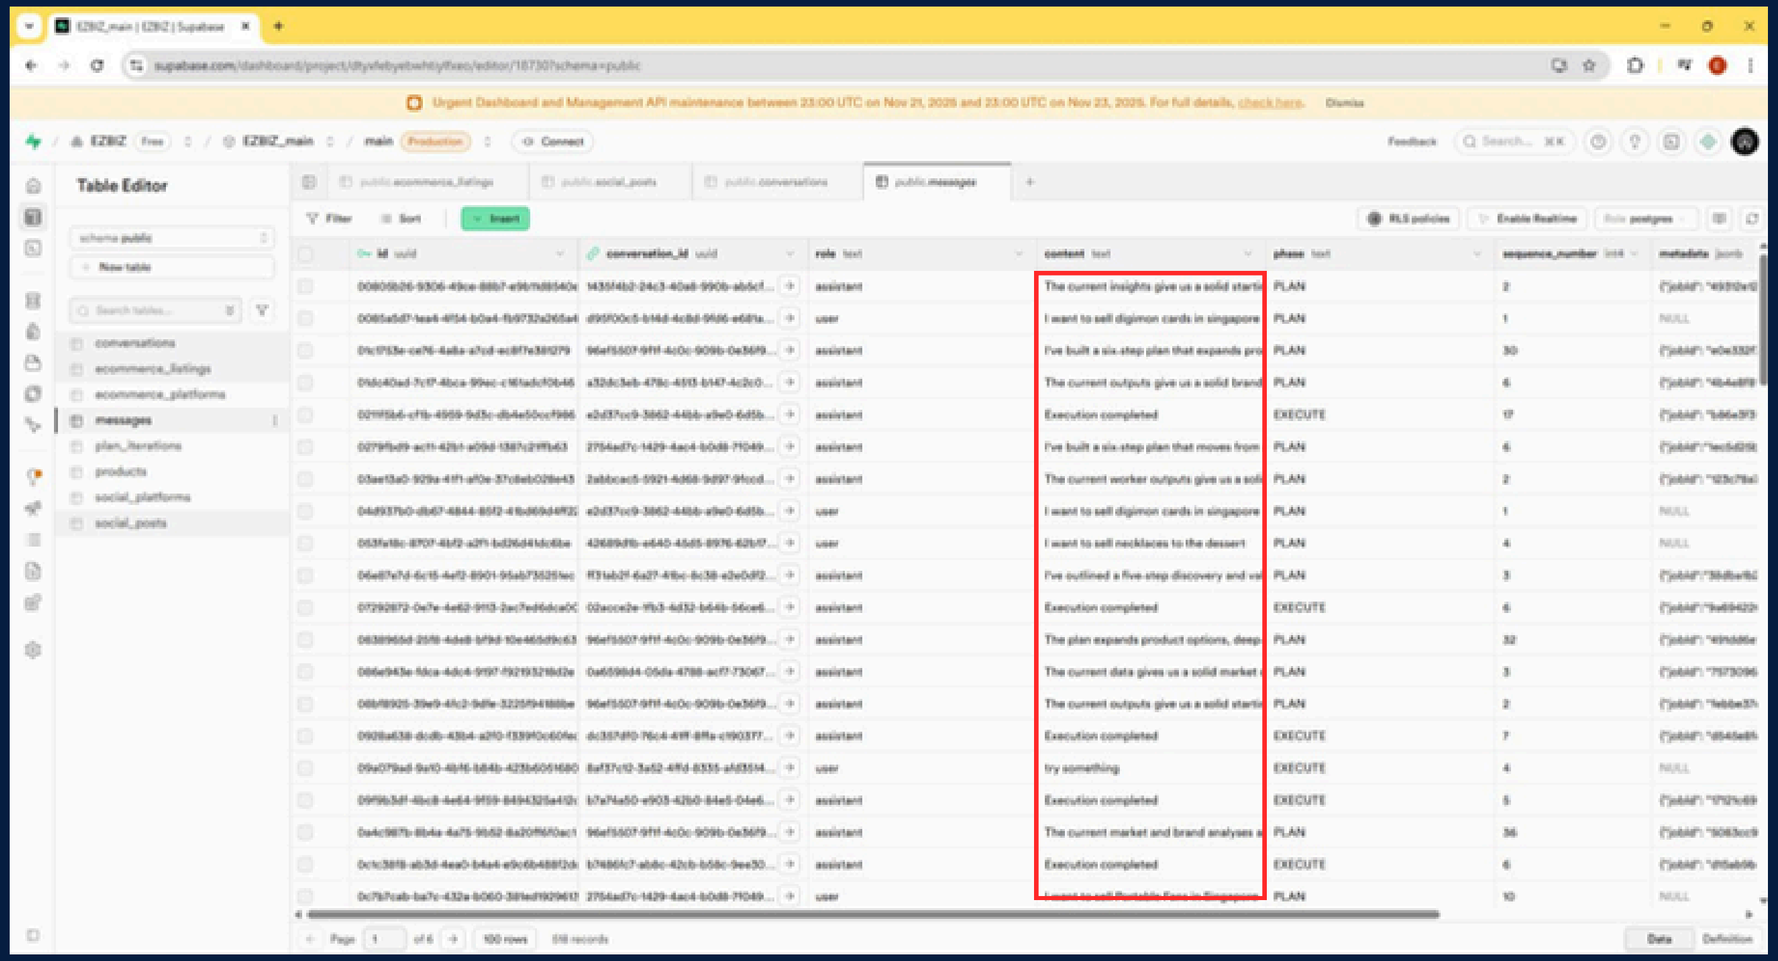

AI Co-Founder for Marketplace Sellers

OUR ARCHITECTURE

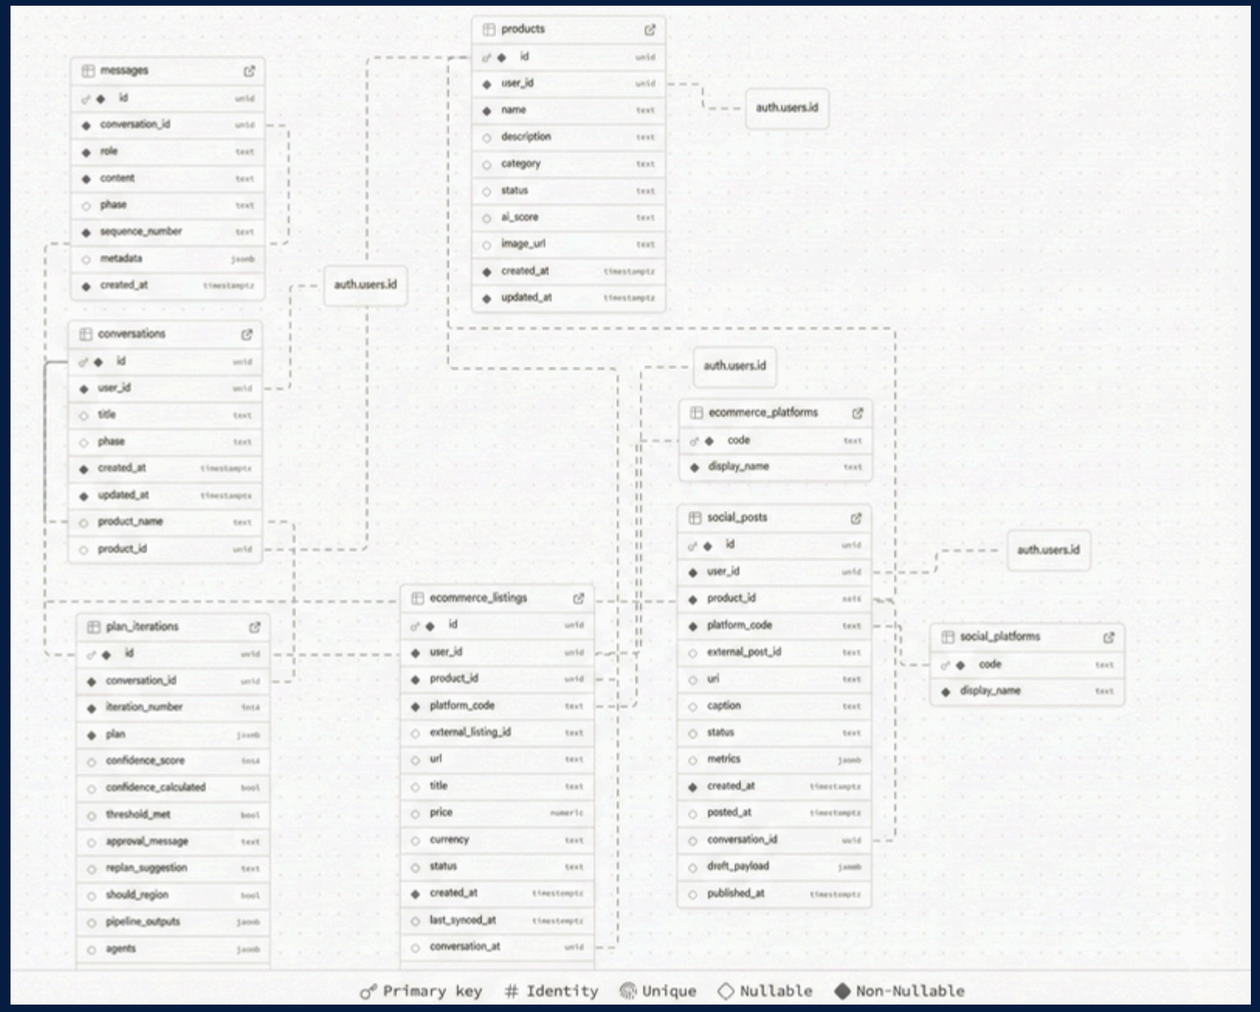

SUPABASE: TABLE EDITOR

This table proves we built a fully functional conversation + workflow engine.
It tracks every message agents generate, in every phase of the workflow:
plan, execute, monitor.

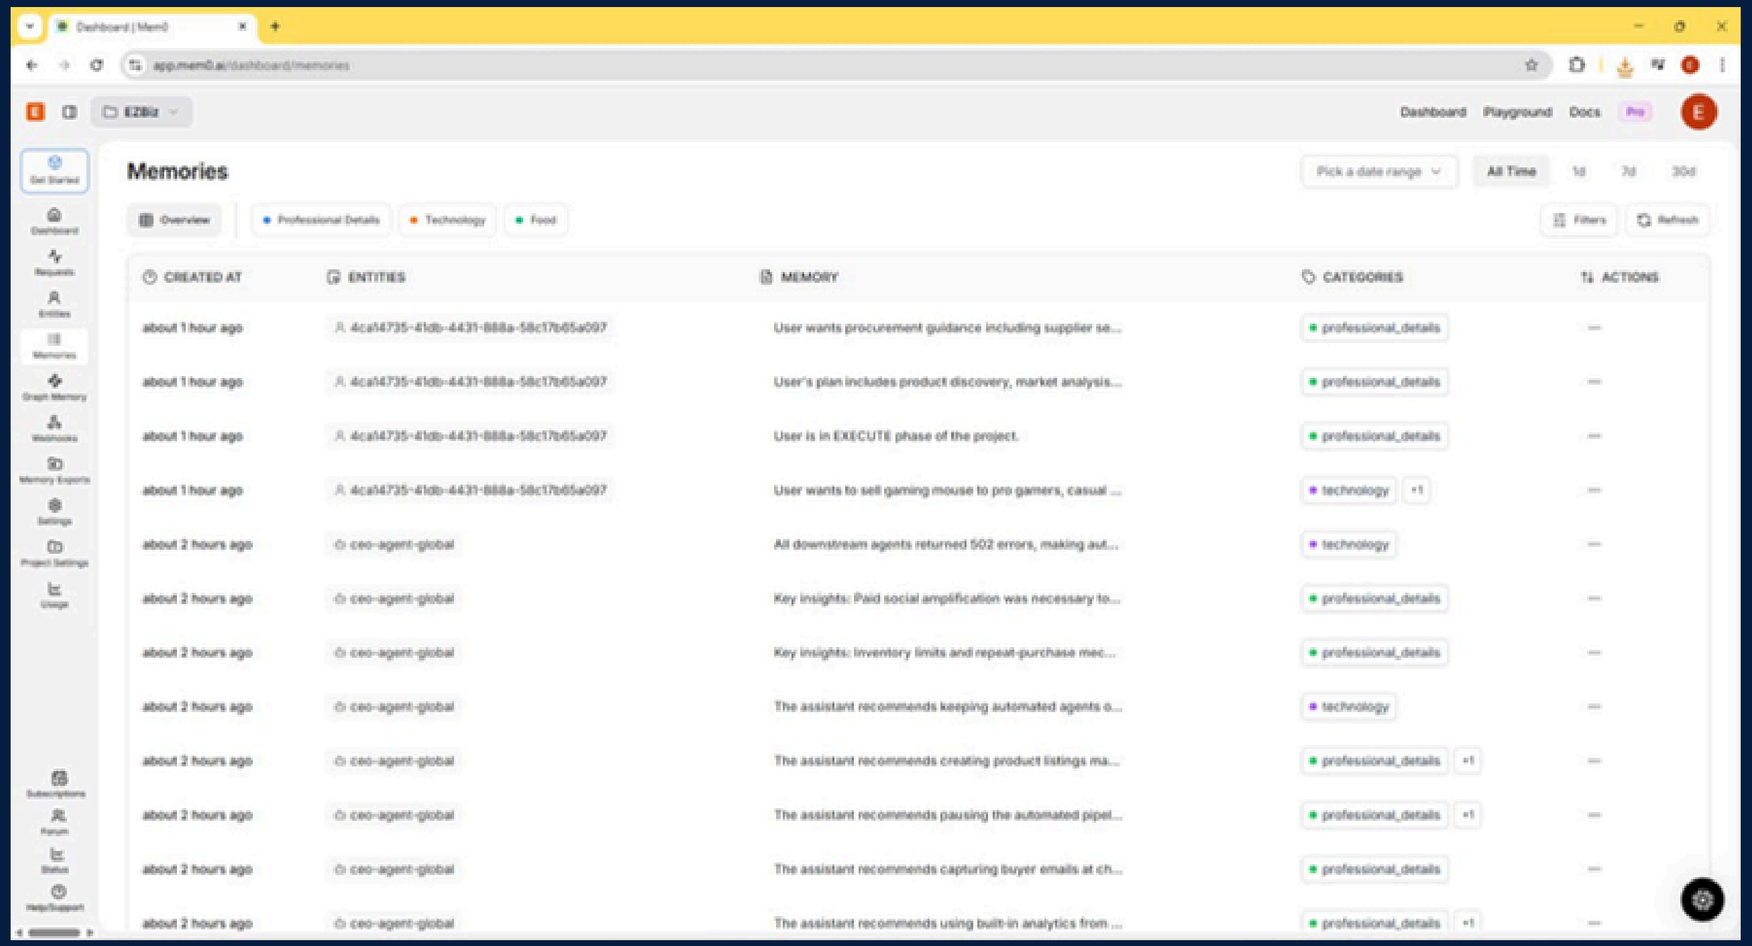

SUPABASE: DATABASE SCHEMA DIAGRAM

This diagram proves our backend is real, structured, and built for scale.
We didn’t just build an agent, we built the entire data model for a real e-commerce system.

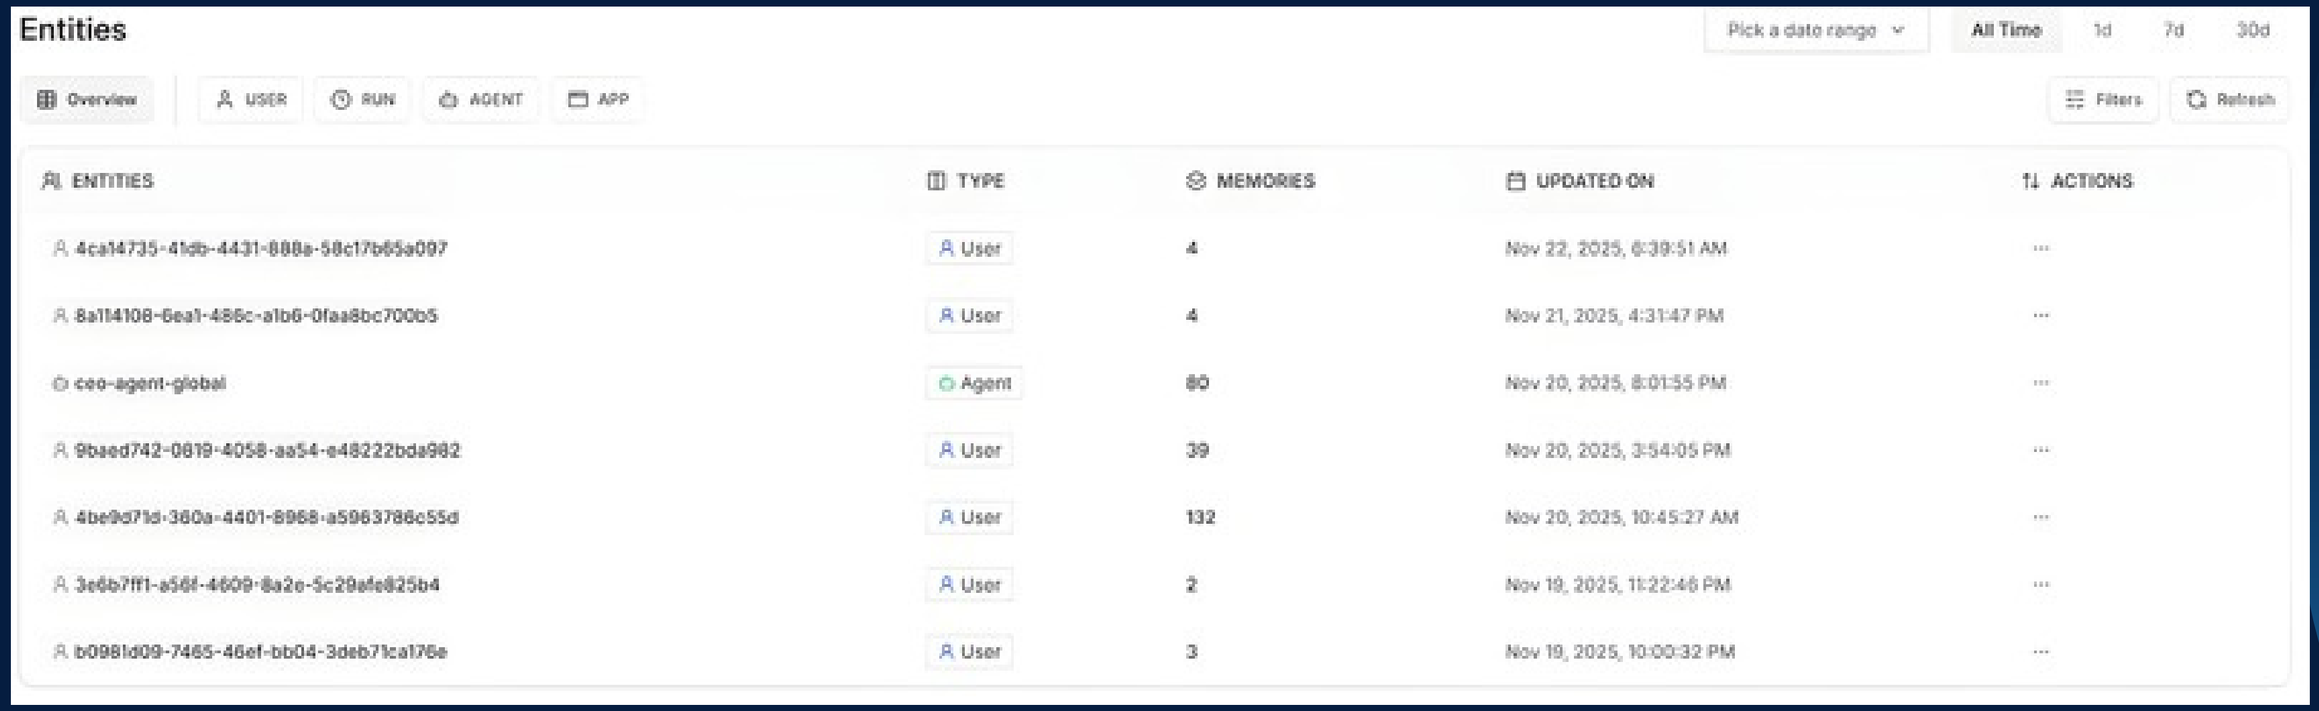

MEM0: MEMORIES DASHBOARD

MEM0 powers long-term memory for our AI agents to store user goals, plan states, insights, and context so the system stays consistent across runs.

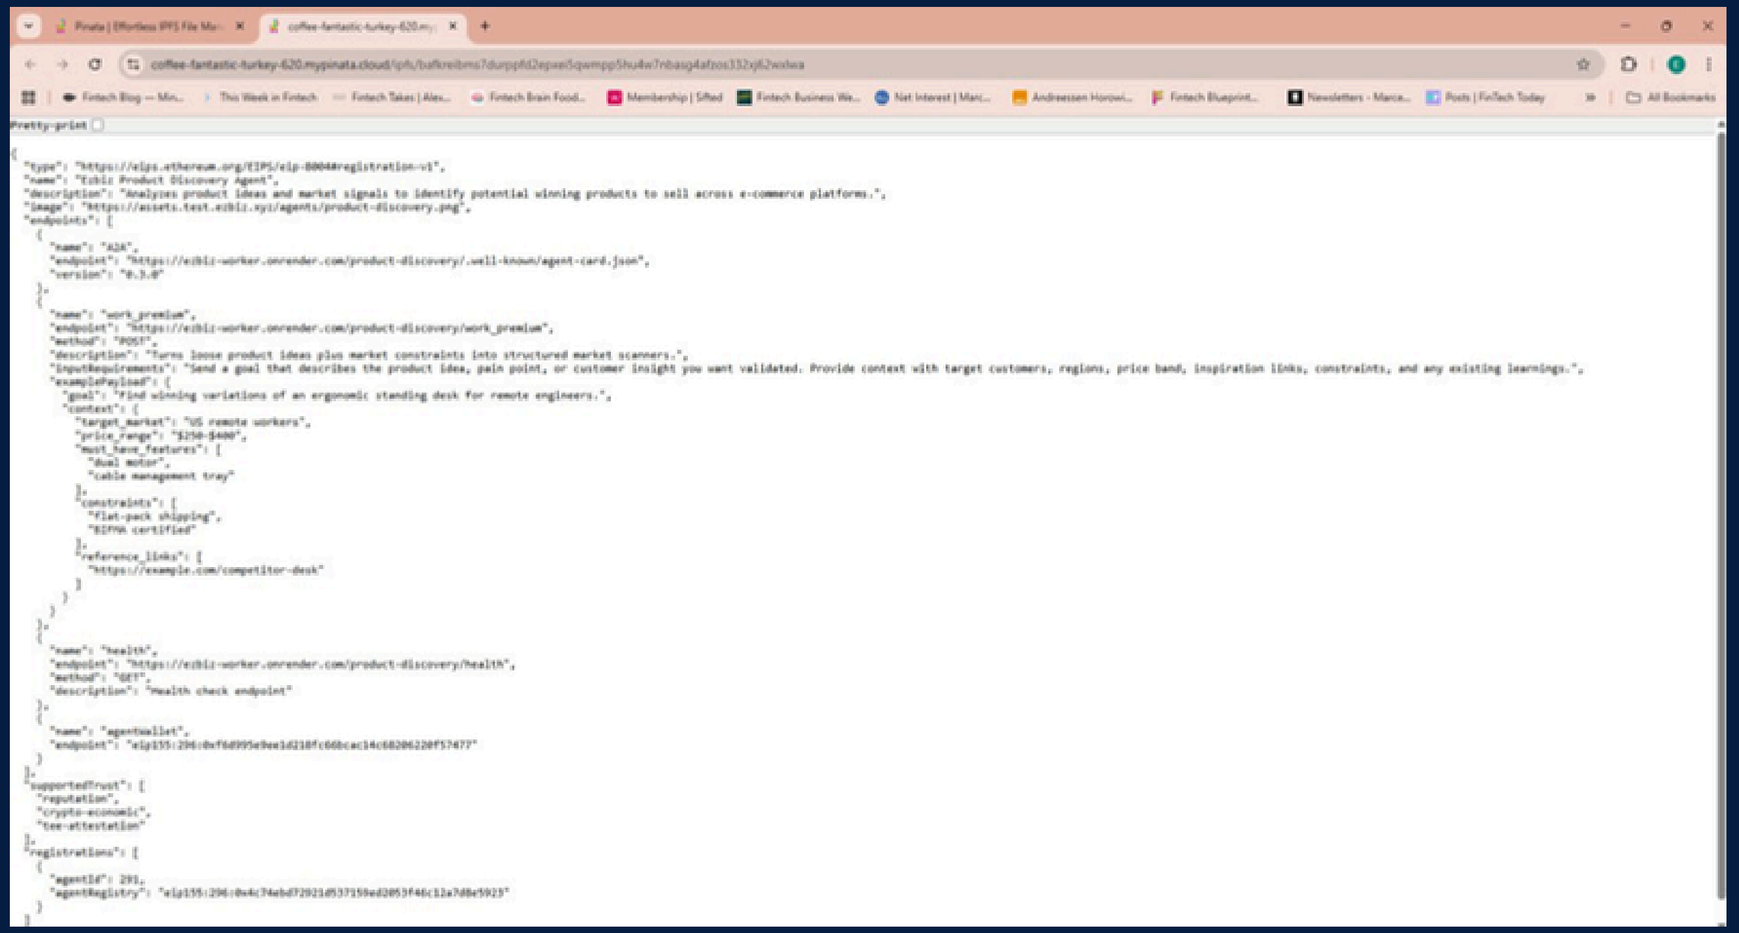

MEM0: ENTITIES DASHBOARD

Each user and each agent is treated as an entity with its own dedicated memory bank, enabling personalisation and agent learning over time.

IPFS

Agent metadata (roles, prompts, pricing) is pinned on IPFS so any Hedera app can trust and reuse it via this URL.

IPFS URL

WHAT WE BUILT

- 7 ERC-8004 worker agents deployed with metadata on IPFS
- Off-chain CEO agent orchestrating all agents
- Full product workflow
- x.402 micropayments integrated into all agents
- End-to-end ecommerce report generation
- Frontend demo with real agent responses

Future Roadmap

1. **Adaptive pricing per agent**
   Pricing adjusts automatically based on each agent's workload and value delivered

2. **More specialist agents**
   Introduce domain-focused agents to handle more specific tasks

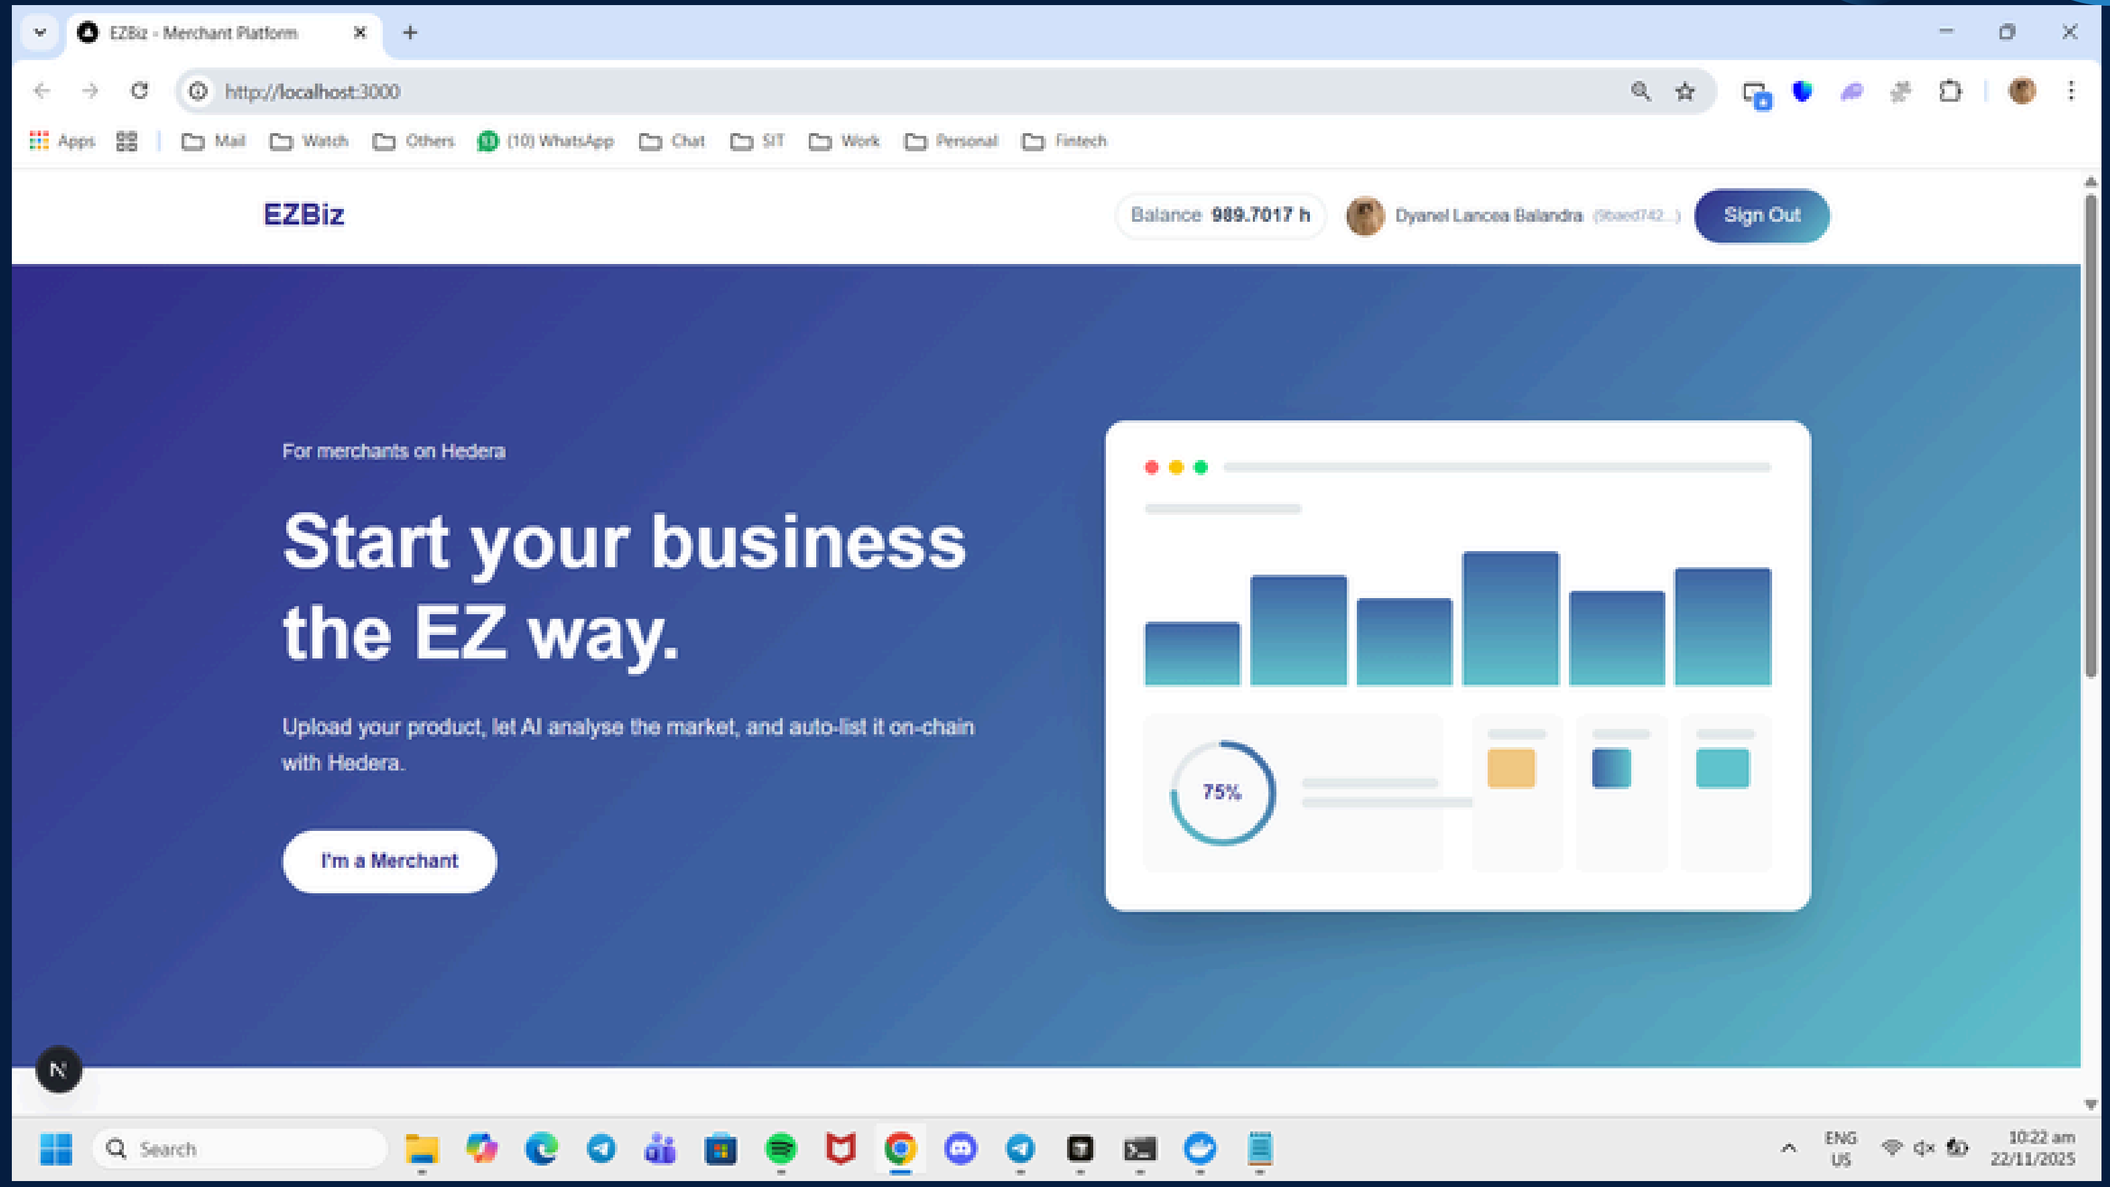

3. **AI Agent Marketplace**
   Launch a marketplace where merchants can discover, compare, and deploy agents

4. **Third-party agent monetisation using HBAR**
   Allow external developers to publish agents and earn HBAR from usage

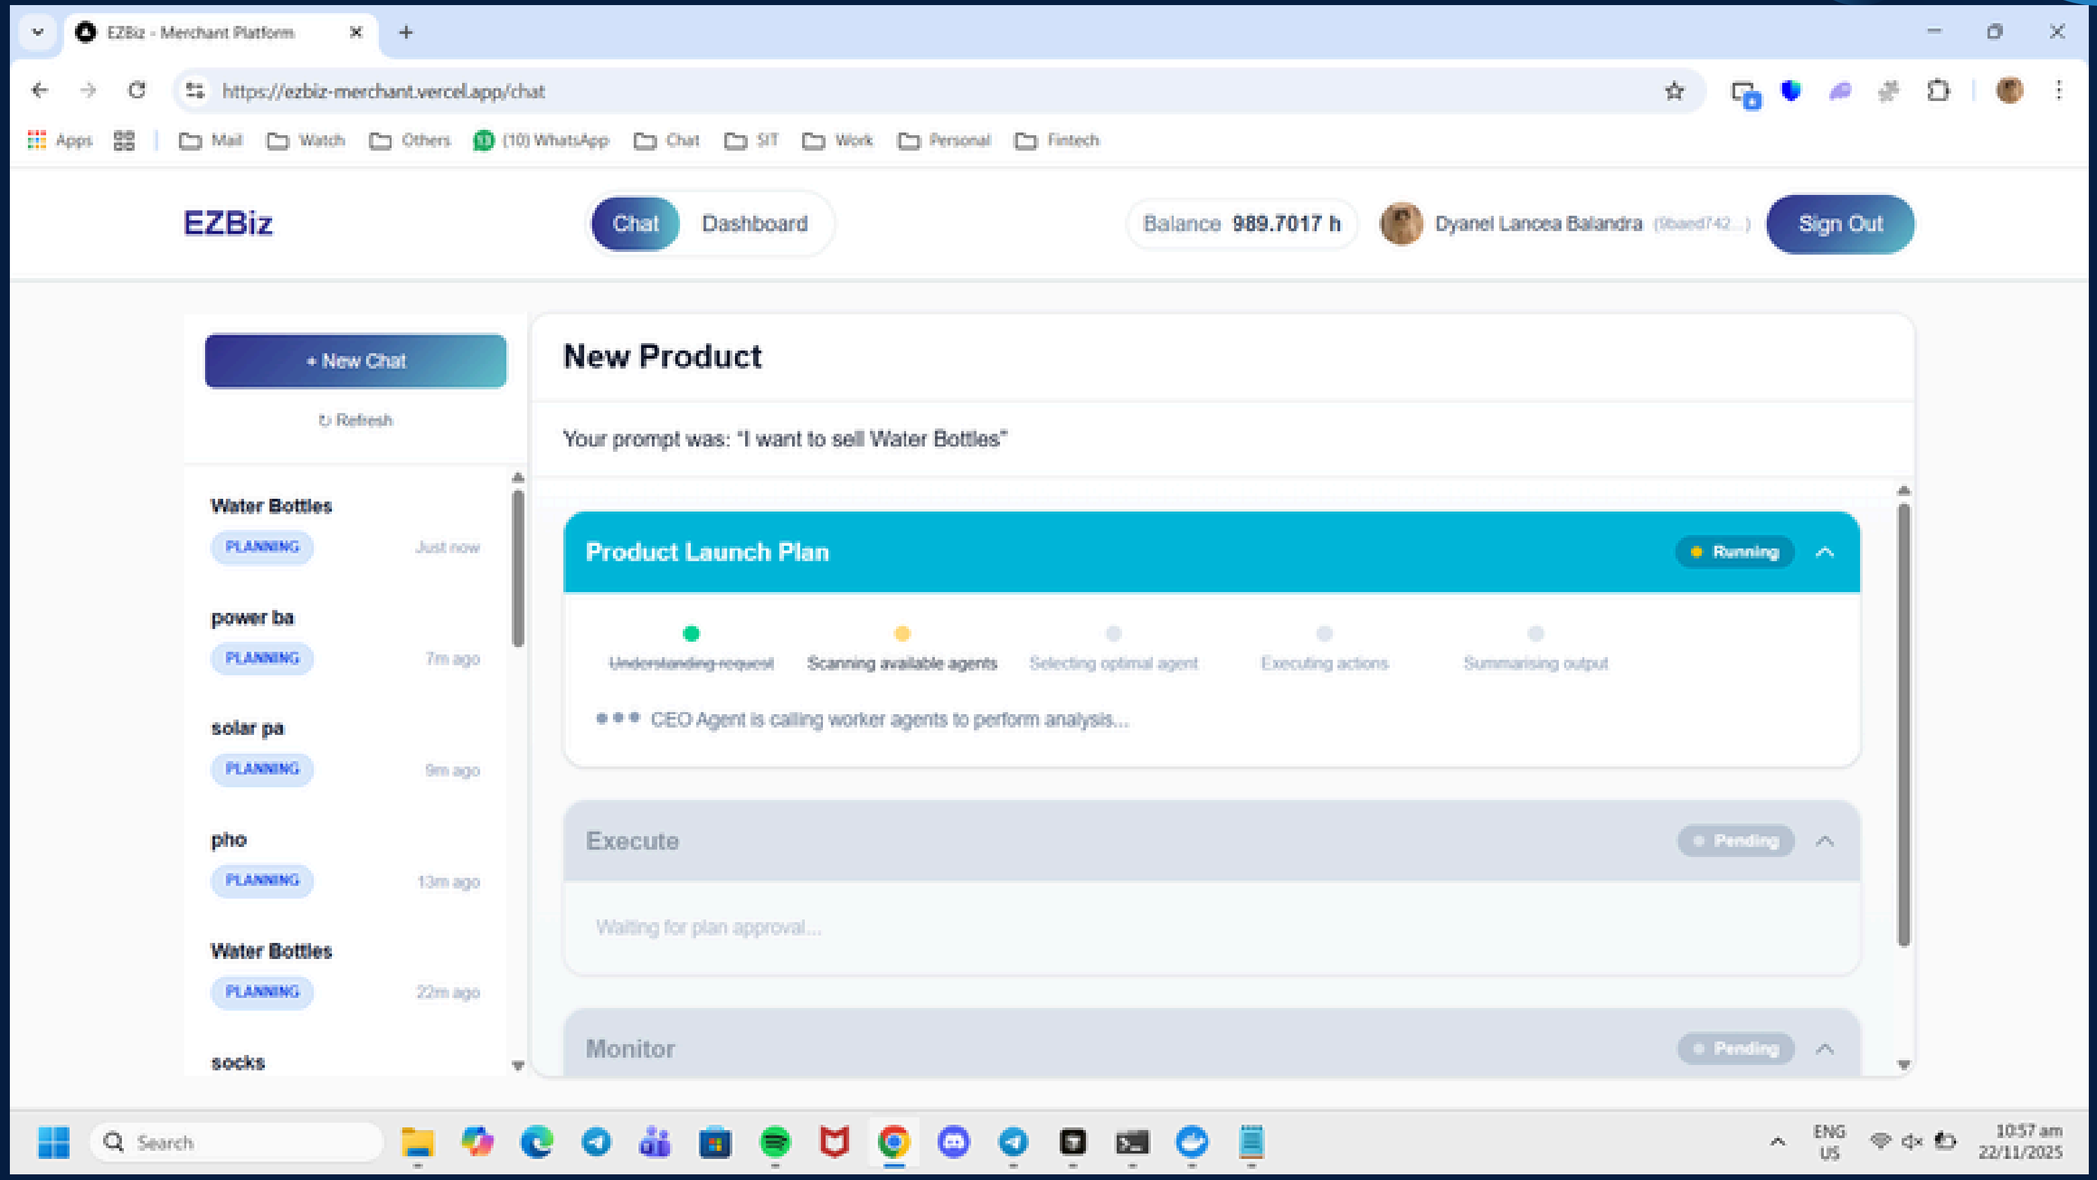

5. **API integrations with marketplaces**
   Enable seamless product listing and syncing with Shopee, Lazada, and other platforms
